Versatility

The ZIVE SP2's system comes with additional three analog inputs (auxiliary voltage input) and 1 analog output along with 3 digital outputs and 2 digital inputs, and one temperature input for K type thermocouple. It will help users expand the usage of the instrument.

For example,

1. User can measure the voltage between working and reference electrode and, by using 2 additional analog inputs(auxiliary voltage input), user can also measure the voltage between reference and counter electrode and working and counter electrode as well.

2. With analog output, the system can control rotating speed of the rotator, MFC flow rate etc. by ±10V full scale.

3. User can control on/off of max. 3 devices by DO etc.

Safety and Maintenance

1. Even though the communication failure occurs between PC and ZIVE SP2, the system continues its experiment on channel and saves the data into ZIVE memory up to 542,000 data point set. After the communication is restored, ZIVE will transfer saved data to PC automatically or user can transfer data when he/she wants. This function will be highly efficient for long time experiment.

2. User can define a safety condition setting by inputting his/her own safety levels for voltage, current, temperature etc. If the measurement value exceeds this setting value, the system will automatically stop to protect the system and cell.

3. If the control value of voltage or current is different from measured value, the experiment will stop automatically to protect the cell.

4. Automatic calibration function is available for user calibration.

The system is controlled from a PC via USB.

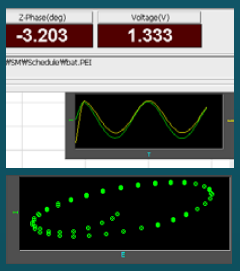
Control & Real Time Graph

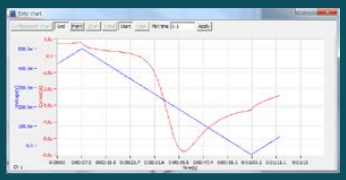
Smart Manager provides 2 kinds of control & data acquisition with real time graph.

User can control and monitor for specific channel in details and he/she can monitor data in VOI(value of interest) window and channel status in one window. Real time graph's X ,Y axis format will be changed per technique automatically. It can be defined by user's demand per techniques.
For experiment using sequence file or batch file, user can designate X,Y parameter on three different real time graph. The real time graph's format can be also selected.



The real time graph and VOI will be changed depending on DC test or impedance test automatically. The virtual control panel always displays the graph for recent test result. For impedance measurement, wave monitor will be displayed on real time graph to check wave's quality. This monitor can be switched to Lissajous(I vs. E) plot.

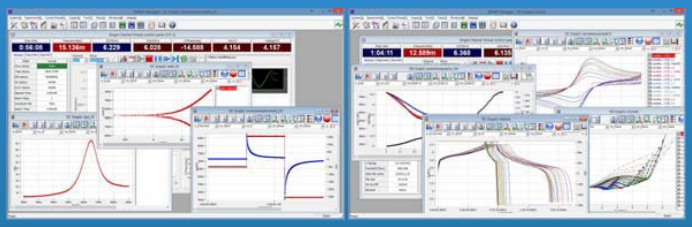
■ Strip Chart

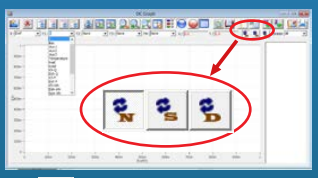


Strip chart recorder function provides real graph function independently. You can monitor 2 Y axis data such as voltage, current, auxV, power, and capacity etc. in real time.

Graph

Smart Manager's graph function is to simplify the operation. There are 3 kinds of graph per each experiment. You can change X, Y1, Y2, Y3, Y4 axis parameter as you want. Each graph provides shortcut buttons. When you click these buttons, the format of the graph will be changed accordingly.





In DC and Cycle graph, whenever you click S or D, the parameters which are related to current such as current, capacity, energy, power, load, etc., are changed into calculated specific value or density value, respectively.

S : value divided by weight D : value divided by active area
